VesiVax[®] TLR4 CALV Kit

\$495.00

The VesiVax[®] TLR4 Conjugatable Adjuvant Lipid Vesicles kit is designed to provide vaccinologists and immunologists access to the excellent immunostimulatory properties of the VesiVax[®] system. The VesiVax[®] TLR4 conjugatable liposome contains a TLR4-specific agonist, monophosphoryl Lipid A, and maleimide groups on the outer surface that allow covalent conjugation with sulfhydryl-containing molecules (e.g., cysteine group on peptides). Maleimides react with sulfhydryl groups to form stable thioether bonds. The optimal pH for the reaction is at pH 7.0. The VesiVax[®] TLR4 kit allows the user to covalently conjugate the desired target antigen for an easy to use antigen delivery method.

Rating:

“Our laboratory was an alpha-test site for the CALV kit. The kit is very easy to use. In laboratory animals, it enabled our antigen of interest to induce good antibody responses” - Zhengrong Cui, Associate Professor, Division of Pharmaceutics, University of Texas at Austin
